Chapter 1

Introduction

Recent advances in DNA sequencing have revolutionized the field of genomics, making it possible for research groups to generate large amounts of sequenced data, very rapidly and at substantially lower cost [?]. The storage of genomic data is being addressed using specific file formats, such as FASTQ and FASTA. Therefore, its analysis and manipulation is crucial [?]. Many frameworks for analysis and manipulation emerged, namely `GALAXY` [?], `GATK` [?], `HTSeq` [?], `MEGA` [?], among others. Several of these frameworks require licenses, while others do not provide a low level access to the information, since they are commonly approached by scripting or programming laguages not efficient for the purpose. Moreover, several lack on variety, namely the ability to perform multiple tasks using only one toolkit.

We describe `GTO`, a complete toolkit for genomics, namely for FASTA-FASTQ formats and sequences (DNA, amino acids, text), with many complementary tools. The toolkit is for Linux- and Unix-based systems, built for ultra-fast computations. `GTO` supports pipes for easy integration with the sub-programs belonging to `GTO` as well as external tools. `GTO` works as the *LEGOs*, since it allows the construction of multiple pipelines with many combinations.

`GTO` includes tools for information display, randomization, edition, conversion, extraction, search, calculation, and visualization. `GTO` is prepared to deal with very large datasets, typically in the scale Gigabytes or Terabytes (but not limited).

The complete toolkit is an optimized command line version, using the prefix "gto-" followed by the suffix with the respective name of the program. `GTO` is implemented in `C` language and it is available, under the MIT license, at:

Genomic sequence tools

Current available genomic sequence tools, for analysis and manipulation, are:

1. `gto_genomic_gen_random_dna`: it generates a synthetic DNA.
2. `gto_genomic_rand_seq_extra_chars`: it substitues in the DNA sequence the outside ACGT chars by random ACGT symbols.

5.1 Program gto_genomic_gen_random_dna

The `gto_genomic_gen_random_dna` generates a synthetic DNA.
For help type:

```
./gto_genomic_gen_random_dna -h
```

In the following subsections, we explain the input and output paramters.

Input parameters

The `gto_genomic_gen_random_dna` program needs one stream for the computation, namely the output standard.
The attribution is given according to:

```
Usage: ./gto_genomic_gen_random_dna [options] [[--] args]
   or: ./gto_genomic_gen_random_dna [options]

It generates a synthetic DNA.

    -h, --help                show this help message and exit

Basic options
    > output.seq              Output synthetic DNA sequence (stdout)
    -s, --seed=<int>          Starting point to the random generator (Default 0)
    -n, --nSymbols=<int>      Number of symbols generated (Default 100)
    -f, --frequency=<str>     The frequency of each base. It should be represented
```

```
                                in the following format: <fa,fc,fg,ft>.

Example: ./gto_genomic_gen_random_dna > output.seq
```

Output

The output of the `gto_genomic_gen_random_dna` program is a sequence group file whith the synthetic DNA.
Using the seed value as 1 and the number of symbols as 400, an example of an execution, is:
