# Chapter 1

## Introduction

Recent advances in DNA sequencing, specifically in next-generation sequencing (NGS), revolutionised the field of genomics, making possible the generation of large amounts of sequencing data very rapidly and at substantially low cost [1]. This new technology also brought with it several challenges, namely in what concerns the analysis, storage, and transmission of the generated sequences [2, 3]. As a consequence, several specialised tools were developed throughout the years in order to deal with these challenges.

Firstly, the storage of the raw data generated by NGS experiments is possible by using several file formats, the FASTQ and FASTA are the most commonly used [4]. FASTQ is an extension of the FASTA format, that besides the nucleotide sequence, also stores associated per base quality score and it is considered the standard format for sequencing data storage and exchange [5].

Regarding the analysis and manipulation of these sequencing data files many software applications emerged, including `fqtools` [6], `FASTX-Toolkit` [7], `GALAXY` [8], `GATK` [9], `MEGA` [10], `SeqKit` [11], among others. `Fqtools` is a suite of tools to view, manipulate and summarise FASTQ data. This software also identifies invalid FASTQ files [6]. `GALAXY`, in its turn, is an open, web-based scientific platform for analysing genomic data [12]. This platform integrates several specialised sets of tools, e.g. for manipulating FASTQ files [13]. `FASTX-Toolkit` is a collection of command-line tools to process FASTA and FASTQ files. This toolkit is available in two forms: as a command-line, or integrated into the web-based platform `GALAXY` [7]. `SeqKit` is another toolkit used to process FASTA and FASTQ files and is available for all major operating systems [11]. The Genome Analysis Toolkit (`GATK`) was designed as a structured programming framework to simplify the development of analysis tools. However, nowadays, it is a suite of tools focused on variant discovering and genotyping [14]. More towards the evolutionary perspectives, Molecular Evolutionary Genetics Analysis (`MEGA`) software provides tools to analyse DNA and protein sequences statistically [15]. Several of these frameworks lack on variety, namely the ability to perform multiple tasks using only one toolkit.

Compression is another important aspect when dealing with high-throughput sequencing data, as it reduces storage space and accelerates data transmission. A survey on DNA compressors and amino acid sequence compression can be found in [16]. Currently, the DNA sequence compressors `HiRGC` [17], `iDo-Comp` [18], `GeCo` [19], and `GDC` [20] are considered to have the best performance [21]. Of these four

approaches, GeCo is the only one that can be used for reference-free and reference-based compression. Furthermore, GeCo can be used as an analysis tool to determine absolute measures for many distance computations and local measures [19].

Amino acid sequences are known to be very hard to compress [22], however, Hosseini et al. [23] recently developed AC, a state-of-the-art for lossless amino acid sequence compression. In [24] the authors compared the performance of AC, in terms of bit-rate, to several general-purpose lossless compressors and several protein compressors, using different proteomes. They concluded that in average AC provides the best bit-rates.

Another relevant subject is genomic data simulation. Read simulations tools are fundamental for the development, testing and evaluation of methods and computational tools [25, 26]. Despite the availability of a large number of real sequence reads, read simulation data is necessary due to the inability to know the ground truth of real data [27]. Escalona *et al.* [28], recently, reviewed 23 NGS simulation tools. XS [29], a FASTQ read simulation tool, stands out in relation to the other 22 simulation tools because it is the only one that does not need a reference sequence. Furthermore, XS is the only open-source tool for simulation of FASTQ reads produced by the four most used sequencing machines, Roche-454, Illumina, ABI SOLiD and Ion Torrent.

Although a large number of tools are available for analysing, compressing, and simulation, these tools are specialised in only a specific task. Besides, in many cases the output of one tool cannot be used directly as input for another tool, e.g. the output of a simulation tool cannot always be used directly as input for an analysis tool. Thus, unique software that includes several specialised tools is necessary.

In this document, we describe **GTO**, a complete toolkit for genomics, namely for FASTQ/A formats and sequences (DNA, amino acids, text), with many complementary tools. The toolkit is for Unix-based systems, built for ultra-fast computations. **GTO** supports pipes for easy integration with the sub-programs belonging to **GTO** as well as external tools. **GTO** works as *LEGOs*, since it allows the construction of multiple pipelines with many combinations.

**GTO** includes tools for information display, randomisation, edition, conversion, extraction, search, calculation, compression, simulation and visualisation. **GTO** is prepared to deal with very large datasets, typically in the scale of Gigabytes or Terabytes (but not limited). The complete toolkit is an optimised command-line version, using the prefix “**gto\_**” followed by the suffix with the respective name of the program. **GTO** is implemented in **C** language and it is available, under the MIT license, at:

```
http://bioinformatics.ua.pt/gto
```

## 1.1 Installation

For **GTO** installation, run:

```
git clone https://github.com/bioinformatics-ua/gto.git
cd gto/src/
make
```

## 1.2 Testing

The examples provided in this document are available in the repository. Therefore, each example can be easily reproduced, which it will also test and validate each tool. It is possible to access the demo files for each tool or run all the tests, as follows:

- Run one test for a specific tool:

```
cd gto/tester/gto_{tool}  
sh runExample.sh
```

- Run the tests for all the tools:

```
cd gto/tester/  
sh runAllTests.sh
```

Some of this tests require internet connection to download external files and it will create new files.

## 1.3 License

The license is **MIT**. In resume, it is a short and simple permissive license with conditions only requiring preservation of copyright and license notices. Licensed works, modifications, and larger works may be distributed under different terms and without source code.

### Permissions:

## Chapter 2

# FASTQ tools

The toolkit has a set of tools dedicated to manipulating FASTQ files. Some of these tools allow the conversion to/from different formats, i. e., there are tools design to convert a FASTQ file into a sequence or a FASTA file, or receive some of these file types and convert to FASTQ.

There are also tools for data manipulation in this format, which are designed to exclude 'N', remove low quality scored reads, following different metrics and randomize some DNA sequences. Succeeding the manipulation, it is possible also to perform analyses over these files, simulations and mutations. Current available tools for FASTQ format analysis and manipulation include:

1. `gto_fastq_to_fasta`: it converts a FASTQ file format to a pseudo FASTA file.
2. `gto_fastq_to_mfasta`: it converts a FASTQ file format to a pseudo Multi-FASTA file.
3. `gto_fastq_exclude_n`: it discards the FASTQ reads with the minimum number of "N" symbols.
4. `gto_fastq_extract_quality_scores`: it extracts all the quality-scores from FASTQ reads.
5. `gto_fastq_info`: it analyses the basic information of FASTQ file format.
6. `gto_fastq_maximum_read_size`: it filters the FASTQ reads with the length higher than the value defined.
7. `gto_fastq_minimum_quality_score`: it discards reads with average quality-score below of the defined.
8. `gto_fastq_minimum_read_size`: it filters the FASTQ reads with the length smaller than the value defined.
9. `gto_fastq_rand_extra_chars`: it substitutes in the FASTQ files, the DNA sequence the outside ACGT chars by random ACGT symbols.
10. `gto_fastq_from_seq`: it converts a genomic sequence to pseudo FASTQ file format.
11. `gto_fastq_mutate`: it creates a synthetic mutation of a FASTQ file given specific rates of mutations, deletions and additions.

12. `gto_fastq_split`: it splits Paired End files according to the direction of the strand ('/1' or '/2').
13. `gto_fastq_pack`: it packages each FASTQ read in a single line.
14. `gto_fastq_unpack`: it unpacks the FASTQ reads packaged using the `gto_fastq_pack` tool.
15. `gto_fastq_quality_score_info`: it analyses the quality-scores of a FASTQ file.
16. `gto_fastq_quality_score_min`: it analyses the minimal quality-scores of a FASTQ file.
17. `gto_fastq_quality_score_max`: it analyses the maximal quality-scores of a FASTQ file.
18. `gto_fastq_cut`: it cuts read sequences in a FASTQ file.
19. `gto_fastq_minimum_local_quality_score_forward`: it filters the reads considering the quality score average of a defined window size of bases.
20. `gto_fastq_minimum_local_quality_score_reverse`: it filters the reverse reads, considering the average window size score defined by the bases.
21. `gto_fastq_xs`: it is a skilled FASTQ read simulation tool, flexible, portable and tunable in terms of sequence complexity.
22. `gto_fastq_clust_reads`: it agroups reads and creates an index file.

## 2.1 Program `gto_fastq_to_fasta`

The `gto_fastq_to_fasta` converts a FASTQ file format to a pseudo FASTA file. However, it does not align the sequence. Also, it extracts the sequence and adds a pseudo header.

For help type:

```
./gto_fastq_to_fasta -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fastq_to_fasta` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTQ file.

The attribution is given according to:

```
Usage: ./gto_fastq_to_fasta [options] [--] args]
or: ./gto_fastq_to_fasta [options]

It converts a FASTQ file format to a pseudo FASTA file.
It does NOT align the sequence.
It extracts the sequence and adds a pseudo header.
```

```

-h, --help          show this help message and exit

Basic options
  < input.fastq      Input FASTQ file format (stdin)
  > output.fasta     Output FASTA file format (stdout)

Example: ./gto_fastq_to_fasta < input.fastq > output.fasta

```

An example of such an input file is:

```

```

## Output

The output of the `gto_fastq_to_fasta` program a FASTA file.

Using the input above, an output example for this is the following:

```

## 2.2 Program `gto_fastq_to_mfasta`

The `gto_fastq_to_mfasta` onverts a FASTQ file format to a pseudo Multi-FASTA file. However, it does not align the sequence. Also, it extracts the sequence and adds a pseudo header.

For help type:

```
./gto_fastq_to_mfasta -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_fastq_to_mfasta` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTQ file.

The attribution is given according to:

```

Usage: ./gto_fastq_to_mfasta [options] [--] args]
or: ./gto_fastq_to_mfasta [options]

It converts a FASTQ file format to a pseudo Multi-FASTA file.

```

```

Usage: ./gto_fastq_exclude_n [options] [--] args]
       or: ./gto_fastq_exclude_n [options]

It discards the FASTQ reads with the minimum number of "N" symbols.
If present, it will erase the second header (after +).

    -h, --help                show this help message and exit

Basic options
    -m, --max=<int>          The maximum of of "N" symbols in the read
    < input.fastq            Input FASTQ file format (stdin)
    > output.fastq           Output FASTQ file format (stdout)

Example: ./gto_fastq_exclude_n -m <max> < input.fastq > output.fastq

Console output example :
<FASTQ non-filtered reads>
Total reads      : value
Filtered reads   : value

## Output

The output of the `gto_fastq_exclude_n` program is a set of all the filtered FASTQ reads, followed by the execution report. The execution report only appears in the console.

Using the input above with the max value as 5, an output example for this is the following:

```

@SRR001666.2 071112_SLXA-EAS1_s_7:5:1:801:338 length=72

## 2.4 Program `gto_fastq_extract_quality_scores`

The `gto_fastq_extract_quality_scores` extracts all the quality-scores from FASTQ reads.

For help type:

```
./gto_fastq_extract_quality_scores -h
```

In the following subsections, we explain the input and output parameters.

## 2.5 Program gto\_fastq\_info

The `gto_fastq_info` analyses the basic information of FASTQ file format.

For help type:

```
./gto_fastq_info -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fastq_info` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTQ file.

The attribution is given according to:

```
Usage: ./gto_fastq_info [options] [--] args]

## Output

The output of the `gto_fastq_info` program is a set of information related to the file read.

Using the input above, an output example for this is the following:

```
Total reads      : 2
Max read length  : 72
Min read length  : 72
Min QS value     : 41

## 2.6 Program `gto_fastq_maximum_read_size`

The `gto_fastq_maximum_read_size` filters the FASTQ reads with the length higher than the value defined.

For help type:

```
./gto_fastq_maximum_read_size -h
```

In the following subsections, we explain the input and output parameters.

## 2.7 Program `gto_fastq_minimum_quality_score`

The `gto_fastq_minimum_quality_score` discards reads with average quality-score below of the defined. For help type:

```
./gto_fastq_minimum_quality_score -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_fastq_minimum_quality_score` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTQ file.

The attribution is given according to:

```
Usage: ./gto_fastq_minimum_quality_score [options] [--] args]
or: ./gto_fastq_minimum_quality_score [options]
```

It discards reads with average quality-score below value.

```
-h, --help          show this help message and exit
```

#### Basic options

```
-m, --min=<int>      The minimum average quality-score (Value 25 or 30 is commonly used)
< input.fastq        Input FASTQ file format (stdin)
```

```
> output.fastq          Output FASTQ file format (stdout)
```

```
Example: ./gto_fastq_minimum_quality_score -m <min> < input.fastq > output.fastq
```

```
Console output example:
```

```
<FASTQ non-filtered reads>
```

```
Total reads      : value

## 2.8 Program `gto_fastq_minimum_read_size`

The `gto_fastq_minimum_read_size` filters the FASTQ reads with the length smaller than the value defined. For help type:

```
./gto_fastq_minimum_read_size -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fastq_minimum_read_size` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTQ file.

The attribution is given according to:

```
Usage: ./gto_fastq_minimum_read_size [options] [--] args]

## 2.10 Program gto\_fastq\_from\_seq

The `gto_fastq_from_seq` converts a genomic sequence to pseudo FASTQ file format.

For help type:

```
./gto_fastq_from_seq -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fastq_from_seq` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence group file.

The attribution is given according to:

```
Usage: ./gto_fastq_from_seq [options] [--] args]
or: ./gto_fastq_from_seq [options]
```

It converts a genomic sequence to pseudo FASTQ file format.

```
-h, --help          show this help message and exit
```

#### Basic options

```
< input.seq        Input sequence file (stdin)

## 2.11 Program gto\_fastq\_mutate

The `gto_fastq_mutate` creates a synthetic mutation of a FASTQ file given specific rates of mutations, deletions and additions. All these parameters are defined by the user, and they are optional.

For help type:

```
./gto_fastq_mutate -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_fastq_mutate` program needs two streams for the computation, namely the input and output standard. However, optional settings can be supplied too, such as the starting point to the random generator, and the edition, deletion and insertion rates. Also, the user can choose to use the ACGTN alphabet in the synthetic mutation. The input stream is a FASTQ File.

The attribution is given according to:

```
Usage: ./gto_fastq_mutate [options] [--] args]
      or: ./gto_fastq_mutate [options]

Basic options
      < input.fasta             Input FASTQ file format (stdin)
      > output.fasta            Output FASTQ file format (stdout)

Optional
      -s, --seed=<int>          Starting point to the random generator
      -m, --mutation-rate=<dbl> Defines the mutation rate (default 0.0)
      -d, --deletion-rate=<dbl> Defines the deletion rate (default 0.0)
      -i, --insertion-rate=<dbl> Defines the insertion rate (default 0.0)
      -a, --ACGTN-alphabet      When active, the application uses the ACGTN alphabet

## 2.12 Program gto\_fastq\_split

The `gto_fastq_split` splits Paired End files according to the direction of the strand ('/1' or '/2'). It writes by default singleton reads as forward stands.

For help type:

```
./gto_fastq_split -h
```

In the following subsections, we explain the input and output paramters.

## Input parameters

The `gto_fastq_split` program needs a stream for the computation, namely the input standard. The input stream is a FASTQ file.

The attribution is given according to:

```
Usage: ./gto_fastq_split [options] [--] args
      or: ./gto_fastq_split [options]
```

It writes by default singleton reads as forward stands.

```
-h, --help          show this help message and exit

## Basic options

```
-f, --forward=<str>    Output forward file
-r, --reverse=<str>    Output reverse file
< input.fastq          Input FASTQ file format (stdin)
> output                Output read information (stdout)
```

Example: `./gto_fastq_split -f <output_forward.fastq> -r <output_reverse.fastq> < input.fastq > output`

Output example :

```
Total reads      : value
Singleton reads  : value
Forward reads    : value
Reverse reads    : value
```

An example of such an input file is:

```
@SRR001666.1 071112_SLXA-EAS1_s_7:5:1:817:345 length=72 1

## Output

The output of the `gto_fastq_split` program is a set of information related to the file read.

Using the input above, an output example for this is the following:

```
Total reads      : 2
Singleton reads  : 0
Forward reads    : 65536
Reverse reads    : 1
```

Also, this program generates two FASTQ files, with the reverse and forward reads.

An example of the forward reads, for the input, is:

[illegible]

## 2.13 Program gto fastq pack

The `gto_fastq_pack` packages each FASTQ read in a single line. It can show the read score first or the dna sequence, depending on the execution mode.

For help type:

```
./gto_fastq_pack -h

## 2.21 Program `gto_fastq_xs`

The `gto_fastq_xs` is a skilled FASTQ read simulation tool, flexible, portable (does not need a reference sequence) and tunable in terms of sequence complexity. XS handles Ion Torrent, Roche-454, Illumina and ABI-SOLiD simulation sequencing types. It has several running modes, depending on the time and memory available, and is aimed at testing computing infrastructures, namely cloud computing of large-scale projects, and testing FASTQ compression algorithms. Moreover, XS offers the possibility of simulating the three main FASTQ components individually (headers, DNA sequences and quality-scores). Quality-scores can be simulated using uniform and Gaussian distributions.

For help type:

```
./gto_xs -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fastq_xs` program needs a FASTQ file to compute.

The attribution is given according to:

```
Usage: XS [OPTION]... [FILE]

System options:
  -h                give this help
  -v                verbose mode

Main FASTQ options:

  -hf <headerFormat>   header format: 1=Length appendix, 2=Pair End
  -i n=<instrumentName> the unique instrument name (use n= before name)
  -o                 use the same header in third line of the read
  -ls <lineSize>       static line (bases/quality scores) size
```

```

-ld <minSize>:<maxSize>    dynamic line (bases/quality scores) size
-n <numberOfReads>         number of reads per file

DNA options:
-f <A>,<C>,<G>,<T>,<N>    symbols frequency
-rn <numberOfRepeats>     repeats: number (default: 0)
-ri <repeatsMinSize>      repeats: minimum size

## Chapter 3

# FASTA tools

The FASTA tool subset has similar goals to the FASTQ tools. With these tools, it is possible convert data from different formats to the FASTA and multi-FASTA files, or the opposite. In these tools, there are also features to extract and filter reads based on patterns, which can solve specific problems in genomic analytic workflows. The currently available FASTA tools, for analysis and manipulation, are:

1. `gto_fasta_to_seq`: it converts a FASTA or Multi-FASTA file format to a seq.
2. `gto_fasta_from_seq`: it converts a genomic sequence to pseudo FASTA file format.
3. `gto_fasta_extract`: it extracts sequences from a FASTA file, which the range is defined by the user in the parameters.
4. `gto_fasta_extract_by_read`: it extracts sequences from each read in a Multi-FASTA file (splited by `\n`), which the range is defined by the user in the parameters.
5. `gto_fasta_info`: it shows the readed information of a FASTA or Multi-FASTA file format.
6. `gto_fasta_mutate`: it reates a synthetic mutation of a fasta file given specific rates of editions, deletions and additions.
7. `gto_fasta_rand_extra_chars`: it substitues in the DNA sequence the outside ACGT chars by random ACGT symbols.
8. `gto_fasta_extract_read_by_pattern`: it extracts reads from a Multi-FASTA file format given a pattern in the header.
9. `gto_fasta_find_n_pos`: it reports the "N" regions in a sequence or FASTA (seq) file.
10. `gto_fasta_split_reads`: it splits a Multi-FASTA file to multiple FASTA files.
11. `gto_fasta_rename_human_headers`: it changes the headers of FASTA or Multi-FASTA file to simple chrX by order, where X is the number.
12. `gto_fasta_extract_pattern_coords`: it extracts the header and coordinates from a Multi-FASTA file format given a pattern/motif in the sequence.

### 3.1 Program gto\_fasta\_to\_seq

The `gto_fasta_to_seq` converts a FASTA or Multi-FASTA file format to a sequence.

For help type:

```
./gto_fasta_to_seq -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_fasta_to_seq` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTA or Multi-FASTA file.

The attribution is given according to:

```
Usage: ./gto_fasta_to_seq [options] [--] args]
      or: ./gto_fasta_to_seq [options]

It converts a FASTA or Multi-FASTA file format to a seq.

      -h, --help                show this help message and exit

Basic options
      < input.fasta             Input FASTA or Multi-FASTA file format (stdin)
      > output.seq              Output sequence file (stdout)

Example: ./gto_fasta_to_seq < input.mfasta > output.seq
```

An example of such an input file is:

## 3.2 Program gto\_fasta\_from\_seq

The `gto_fasta_from_seq` converts a genomic sequence to pseudo FASTA file format.

For help type:

```
./gto_fasta_from_seq -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_fasta_from_seq` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence group file.

The attribution is given according to:

```
Usage: ./gto_fasta_from_seq [options] [--] args]
or: ./gto_fasta_from_seq [options]

It converts a genomic sequence to pseudo FASTA file format.

    -h, --help                show this help message and exit

Basic options
    < input.seq              Input sequence file (stdin)
    > output.fasta           Output FASTA file format (stdout)

Optional options
    -n, --name=<str>         The read's header
    -l, --lineSize=<int>     The maximum of chars for line

Example: ./gto_fasta_from_seq -l <lineSize> -n <name> < input.seq > output.fasta

## 3.3 Program `gto_fasta_extract`

The `gto_fasta_extract` extracts sequences from a FASTA file, which the range is defined by the user in the parameters.

For help type:

```
./gto_fasta_extract -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fasta_extract` program needs two parameters, which defines the begin and the end of the extraction, and two streams for the computation, namely the input and output standard. The input stream is a FASTA file.

The attribution is given according to:

```
Usage: ./gto_fasta_extract [options] [--] args]
or: ./gto_fasta_extract [options]

It extracts sequences from a FASTA file.

-h, --help          show this help message and exit
```

#### Basic options

<code>-i, --init=&lt;int&gt;</code>	The first position to start the extraction (default 0)
<code>-e, --end=&lt;int&gt;</code>	The last extract position (default 100)
<code>&lt; input.fasta</code>	Input FASTA or Multi-FASTA file format (stdin)
<code>&gt; output.seq</code>	Output sequence file (stdout)

Example: `./gto_fasta_extract -i <init> -e <end> < input.fasta > output.seq`

An example of such an input file is:

## Output

The output of the `gto_fasta_extract` program is a group sequence.

Using the input above with the value 0 as the extraction starting point and the 50 as the ending, an output example for this is the following:

```
ACAAGACGGCCTCCTGCTGCTGCTGCTCCTCGGGGCCACGGCCCTGGAGG
```

## 3.4 Program `gto_fasta_extract_by_read`

The `gto_fasta_extract_by_read` extracts sequences from a FASTA or Multi-FASTA file, which the range is defined by the user in the parameters.

For help type:

```
./gto_fasta_extract_by_read -h
```

In the following subsections, we explain the input and output parameters.

## 3.5 Program `gto_fasta_info`

The `gto_fasta_info` shows the readed information of a FASTA or Multi-FASTA file format.

For help type:

```
./gto_fasta_info -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_fasta_info` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTA or Multi-FASTA file.

The attribution is given according to:

```
Usage: ./gto_fasta_info [options] [--] args]
       or: ./gto_fasta_info [options]

It shows read information of a FASTA or Multi-FASTA file format.

### 3.6 Program gto\_fasta\_mutate

The `gto_fasta_mutate` creates a synthetic mutation of a FASTA file given specific rates of editions, deletions and additions. All these parameters are defined by the user, and their are optional.

For help type:

```
./gto_fasta_mutate -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_fasta_mutate` program needs two streams for the computation, namely the input and output standard. However, optional settings can be supplied too, such as the starting point to the random generator, and the edition, deletion and insertion rates. Also, the user can choose to use the ACGTN alphabet in the synthetic mutation. The input stream is a FASTA or Multi-FASTA File.

The attribution is given according to:

```
Usage: ./gto_fasta_mutate [options] [--] args]
      or: ./gto_fasta_mutate [options]

      > output.fasta            Output FASTA or Multi-FASTA file format (stdout)

Optional
      -s, --seed=<int>          Starting point to the random generator
      -e, --edit-rate=<dbl>     Defines the edition rate (default 0.0)
      -d, --deletion-rate=<dbl> Defines the deletion rate (default 0.0)
      -i, --insertion-rate=<dbl> Defines the insertion rate (default 0.0)
      -a, --ACGTN-alphabet      When active, the application uses the ACGTN alphabet

Example: ./gto_fasta_mutate -s <seed> -e <edit rate> -d <deletion rate> -i
<insertion rate> -a < input.mfasta > output.fasta

## 3.8 Program gto\_fasta\_extract\_read\_by\_pattern

The gto\_fasta\_extract\_read\_by\_pattern extracts reads from a Multi-FASTA file format given a pattern in the header. Also, this pattern is case insensitive.

For help type:

```
./gto_fasta_extract_read_by_pattern -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_fasta_extract_read_by_pattern` program needs two streams for the computation, namely the input and output standard. The input stream is a Multi-FASTA file.

The attribution is given according to:

```
Usage: ./gto_fasta_extract_read_by_pattern [options] [--] args]
       or: ./gto_fasta_extract_read_by_pattern [options]
```

It extracts reads from a Multi-FASTA file format given a pattern in the header (ID).

```
-h, --help          show this help message and exit
```

### Basic options

```
-p, --pattern=<str>  Pattern to search in the file header
< input.fasta        Input Multi-FASTA file format (stdin)
> output.fasta        Output Multi-FASTA file format (stdout)
```

```
Example: ./gto_fasta_extract_read_by_pattern -p <pattern> < input.mfasta > output.fasta
```

An example of such an input file is:

```

## Output

The output of the `gto_fasta_extract_read_by_pattern` program is a Multi-FASTA file.

Using the input above with the pattern value as "264", an output example for this is the following:

```

### 3.9 Program gto\_fasta\_find\_n\_pos

The `gto_fasta_find_n_pos` reports the "N" regions in a sequence or FASTA (seq) file.

For help type:

```
./gto_fasta_find_n_pos -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_fasta_find_n_pos` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTA file or a sequence.

The attribution is given according to:

```
Usage: ./gto_fasta_find_n_pos [options] [--] args]
or: ./gto_fasta_find_n_pos [options]

It reports the 'N' regions in a sequence or FASTA (seq) file.

    -h, --help                show this help message and exit

Basic options
    < input.fasta             Input FASTQ file format or a sequence (stdin)
    > output                  Output report of 'N' positions (stdout)

Example: ./gto_fasta_find_n_pos < input.fasta > output

The output obeys the following structure:
Begin   End Positions
<value> <value> <value>
```

An example of such an input file is:

```
>AB000264 |acc=AB000264|descr=Homo sapiens mRNA
NCNNNACGGCCTCCTGCTGCTGCTCTCCGGGGCCACGGCCCTGGAGGGTCCACCGCTGCCCTGCTGCCATTGTCCCC

GCGAATCCGCGCGCCGGGACAGAATCTCCTGCAAAGCCCTGCAGGAACNTCTTCTGGAAGACCTTCTCCACCCCCCAGC
TAAACCTCACCCATGAATGCTCAGCAAGTTTAATTACAGACCTGAN
```

#### Output

The output of the `gto_fasta_find_n_pos` program is a structured report of "N" appearances in the sequence or FASTA file. The first column is the first position of the "N" appearance, the second is the position of the last "N" in the interval found, and the last column is the count of "N" in this interval.

Using the input above, an output example for this is the following:

```

1    1    1
3    5    3
82   82   1
163  163  1
289  289  1

```

### 3.10 Program gto\_fasta\_split\_reads

The `gto_fasta_split_reads` splits a Multi-FASTA file to multiple FASTA files.

For help type:

```
./gto_fasta_split_reads -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_fasta_split_reads` program needs one stream for the computation, namely the input standard. This input stream is a Multi-FASTA file.

The attribution is given according to:

```

Usage: ./gto_fasta_split_reads [options] [--] args]
       or: ./gto_fasta_split_reads [options]

It splits a Multi-FASTA file to multiple FASTA files.

    -h, --help                show this help message and exit

Basic options
    < input.fasta             Input Multi-FASTA file format (stdin)

Optional options
    -l, --location=<str>     Location to store the files

Example: ./gto_fasta_split_reads < input.mfasta

```

An example of such an input file is:

## Output

The output of the `gto_fasta_split_reads` program is a report summary of the execution, and the files created in the defined location.

Using the input above, an output example for this is the following:

```
1 : Splitting to file:./out1.fasta
2 : Splitting to file:./out2.fasta
```

### 3.11 Program `gto_fasta_rename_human_headers`

The `gto_fasta_rename_human_headers` changes the headers of FASTA or Multi-FASTA file to simple chrX by order, where X is the number.

For help type:

```
./gto_fasta_rename_human_headers -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_fasta_rename_human_headers` program needs two streams for the computation, namely the input and output standard. The input stream is a FASTA or Multi-FASTA file.

## 3.12 Program `gto_fasta_extract_pattern_coords`

The `gto_fasta_extract_pattern_coords` extracts the header and coordinates from a Multi-FASTA file format given a pattern/motif in the sequence.

For help type:

```
./gto_fasta_extract_pattern_coords -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_fasta_extract_pattern_coords` program needs two streams for the computation, namely the input and output standard. The input stream is a Multi-FASTA file.

The attribution is given according to:

## Chapter 4

# Genomic sequence tools

The Genomic Sequence subset works directly with the DNA sequences, without any standard format. These tools allow the data extraction, summarising and some mathematical operations over those files. Usually, these are used in the pipeline as a complementary tool. The current available genomic sequence tools, for analysis and manipulation, are:

1. `gto_genomic_gen_random_dna`: it generates a synthetic DNA.
2. `gto_genomic_rand_seq_extra_chars`: it substitutes in the DNA sequence the outside ACGT chars by random ACGT symbols.
3. `gto_genomic_dna_mutate`: it creates a synthetic mutation of a sequence file given specific rates of mutations, deletions and additions.
4. `gto_genomic_extract`: it extracts sequences from a sequence file, which the range is defined by the user in the parameters.
5. `gto_genomic_period`: it calculates the best order depth of a sequence, using FCMs.
6. `gto_genomic_count_bases`: it counts the number of bases in sequence, FASTA or FASTQ files.

### 4.1 Program `gto_genomic_gen_random_dna`

The `gto_genomic_gen_random_dna` generates a synthetic DNA.

For help type:

```
./gto_genomic_gen_random_dna -h
```

In the following subsections, we explain the input and output paramters.

## Input parameters

The `gto_genomic_gen_random_dna` program needs one stream for the computation, namely the output standard.

The attribution is given according to:

```
Usage: ./gto_genomic_gen_random_dna [options] [--] args]
       or: ./gto_genomic_gen_random_dna [options]

It generates a synthetic DNA.

    -h, --help                show this help message and exit

Basic options
    > output.seq              Output synthetic DNA sequence (stdout)

Optional
    -s, --seed=<int>          Starting point to the random generator (Default 0)
    -n, --nSymbols=<int>      Number of symbols generated (Default 100)
    -f, --frequency=<str>     The frequency of each base. It should be represented
                               in the following format: <fa,fc,fg,ft>.

Example: ./gto_genomic_gen_random_dna -s <seed> -n <nsybomls> -f <fa,fc,fg,ft> > output.seq
```

## Output

The output of the `gto_genomic_gen_random_dna` program is a sequence group file with the synthetic DNA.

Using the input above with the seed value as 1 and the number of symbols as 400, an output example for this is the following:

```

## 4.2 Program `gto_genomic_rand_seq_extra_chars`

The `gto_genomic_rand_seq_extra_chars` substitutes in the DNA sequence the outside ACGT chars by random ACGT symbols. It works in sequence file formats.

For help type:

```
./gto_genomic_rand_seq_extra_chars -h
```

In the following subsections, we explain the input and output paramters.

## Input parameters

The `gto_genomic_rand_seq_extra_chars` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence file.

The attribution is given according to:

```
Usage: ./gto_genomic_rand_seq_extra_chars [options] [--] args]
       or: ./gto_genomic_rand_seq_extra_chars [options]

It substitutes in the DNA sequence the outside ACGT chars by random ACGT symbols.
It works in sequence file formats

## 4.3 Program gto\_genomic\_dna\_mutate

The `gto_genomic_dna_mutate` creates a synthetic mutation of a sequence file given specific rates of mutations, deletions and additions. All these parameters are defined by the user, and they are optional.

For help type:

```
./gto_genomic_dna_mutate -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_genomic_dna_mutate` program needs two streams for the computation, namely the input and output standard. However, optional settings can be supplied too, such as the starting point to the random generator, and the edition, deletion and insertion rates. Also, the user can choose to use the ACGTN alphabet in the synthetic mutation. The input stream is a sequence File.

The attribution is given according to:

```
Usage: ./gto_genomic_dna_mutate [options] [--] args
      or: ./gto_genomic_dna_mutate [options]

Creates a synthetic mutation of a sequence file given specific rates of mutations,
deletions and additions

      -h, --help                show this help message and exit

Basic options
      < input.seq               Input sequence file (stdin)
      > output.seq              Output sequence file (stdout)

Optional
      -s, --seed=<int>          Starting point to the random generator
      -m, --mutation-rate=<dbl> Defines the mutation rate (default 0.0)
      -d, --deletion-rate=<dbl> Defines the deletion rate (default 0.0)
      -i, --insertion-rate=<dbl> Defines the insertion rate (default 0.0)
      -a, --ACGTN-alphabet      When active, the application uses the ACGTN alphabet

Example: ./gto_genomic_dna_mutate -s <seed> -m <mutation rate> -d <deletion rate> -i

## 4.4 Program `gto_genomic_extract`

The `gto_genomic_extract` extracts sequences from a sequence file, which the range is defined by the user in the parameters.

For help type:

```
./gto_genomic_extract -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_genomic_extract` program needs two parameters, which defines the begin and the end of the extraction, and two streams for the computation, namely the input and output standard. The input stream is a sequence file.

The attribution is given according to:

```
Usage: ./gto_genomic_extract [options] [--] args]
or: ./gto_genomic_extract [options]

It extracts sequences from a sequence file.

    -h, --help            show this help message and exit

Basic options
    -i, --init=<int>      The first position to start the extraction (default 0)

## Output

The output of the `gto_genomic_extract` program is a group sequence.

Using the input above with the value 0 as the extraction starting point and the 50 as the ending, an output example for this is the following:

```
TCTTTACTCGCGCGTTGGAGAAATACAATAGTGC GGCTCTGTCTCCTTAT
```

## 4.5 Program `gto_genomic_period`

The `gto_genomic_period` calculates the best order depth of a sequence, using FCMs. It only works "ACGT", while the rest will be discarded.

This application has a dependency to represent the results. It requires the Gnuplot to show the execution result.

For help type:

```
./gto_genomic_period -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_genomic_period` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence file.

The attribution is given according to:

```
Usage: ./gto_genomic_period [options] [--] args]
or: ./gto_genomic_period [options]
```

## 4.6 Program gto\_genomic\_count\_bases

The `gto_genomic_count_bases` counts the number of bases in sequence, FASTA or FASTQ files.

For help type:

```
./gto_genomic_count_bases -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_genomic_count_bases` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence, FASTA or FASTQ file.

The attribution is given according to:

```

Usage: ./gto_genomic_count_bases [options] [--] args]
       or: ./gto_genomic_count_bases [options]

It counts the number of bases in sequence, FASTA or FASTQ files.

    -h, --help      Show this help message and exit

Basic options
    < input          Input sequence, FASTA or FASTQ file format (stdin)
    > output          Output read information (stdout)

Example: ./gto_genomic_count_bases < input.seq > output

Output example :

# Amino acid sequence tools

A more specific subset of tools is the Amino Acid Sequence tools, designed to manipulate amino acid sequences. The main features of those tools are grouping sequences, for instance by their properties, such as electric charge (positive and negative), uncharged side chains, hydrophobic side chains and special cases. It is also possible generating pseudo-DNA with characteristics passed by amino acid sequences, or for data compression, using cooperation between multiple contexts and substitutional tolerant context models. The current available amino acid sequence tools, for analysis and manipulation, are:

1. `gto_amino_acid_to_group`: it converts an amino acid sequence to a group sequence.
2. `gto_amino_acid_to_pseudo_dna`: it converts an amino acid (protein) sequence to a pseudo DNA sequence.
3. `gto_amino_acid_compressor`: it is a new lossless compressor to compress efficiently amino acid sequences (proteins).

### 5.1 Program `gto_amino_acid_to_group`

The `gto_amino_acid_to_group` converts an amino acid sequence to a group sequence.

For help type:

```
./gto_amino_acid_to_group -h
```

In the following subsections, we explain the input and output parameters.

#### Input parameters

The `gto_amino_acid_to_group` program needs two streams for the computation, namely the input and output standard. The input stream is an amino acid sequence. The attribution is given according to:

```
Usage: ./gto_amino_acid_to_group [options] [--] args]
or: ./gto_amino_acid_to_group [options]
```

It converts a amino acid sequence to a group sequence.

-h, --help                    show this help message and exit

#### Basic options

< input.prot                Input amino acid sequence file (stdin)  
> output.group              Output group sequence file (stdout)

Example: ./gto\_amino\_acid\_to\_group < input.prot > output.group

Table:

## 5.2 Program gto\_amino\_acid\_to\_pseudo\_dna

The `gto_amino_acid_to_pseudo_dna` converts an amino acid (protein) sequence to a pseudo DNA sequence.

For help type:

```
./gto_amino_acid_to_pseudo_dna -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

## 5.3 Program `gto_amino_acid_compressor`

The `gto_amino_acid_compressor` is a new lossless compressor to compress efficiently amino acid sequences (proteins). It uses a cooperation between multiple context and substitutional tolerant context models. The cooperation between models is balanced with weights that benefit the models with better performance according to a forgetting function specific for each model.

For help type:

```
./gto_amino_acid_compressor -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_amino_acid_compressor` program needs a file with amino acid sequences to compress.

The attribution is given according to:

Usage: ./gto\_amino\_acid\_compressor [OPTION]... -r [FILE] [FILE]:[...]  
 Compression of amino acid sequences.

Non-mandatory arguments:

```
-h                give this help,
-s                show AC compression levels,
-v                verbose mode (more information),
-V                display version number,
-f                force overwrite of output,
-l <level>        level of compression [1;7] (lazy -tm setup),
-t <threshold>    threshold frequency to discard from alphabet,
-e                it creates a file with the extension ".iae"
                  with the respective information content.

-rm <c>:<d>:<g>/<m>:<e>:<a>  reference model (-rm 1:10:0.9/0:0:0),
-rm <c>:<d>:<g>/<m>:<e>:<a>  reference model (-rm 5:90:0.9/1:50:0.8),
...
-tm <c>:<d>:<g>/<m>:<e>:<a>  target model (-tm 1:1:0.8/0:0:0),
-tm <c>:<d>:<g>/<m>:<e>:<a>  target model (-tm 7:100:0.9/2:10:0.85),
...

                  target and reference templates use <c> for
                  context-order size, <d> for alpha (1/<d>), <g>
                  for gamma (decayment forgetting factor) [0;1),
                  <m> to the maximum sets the allowed mutations,
                  on the context without being discarded (for
                  deep contexts), under the estimator <e>, using
                  <a> for gamma (decayment forgetting factor)
                  [0;1) (tolerant model),

-r <FILE>         reference file ("-rm" are loaded here),
```

Mandatory arguments:

```
<FILE>:<...>:<...>    file to compress (last argument). For more
                      files use splitting ":" characters.
```

Example:

```
[Compress]    ./gto_amino_acid_compressor -v -tm 1:1:0.8/0:0:0 -tm 5:20:0.9/3:20:0.9 seq.txt
[Decompress]  ./gto_amino_acid_decompressor -v seq.txt.co
```

In the following example, it will be downloaded nine amino acid sequences and compress and decompress one of the smallest (HI). Finally, it compares if the uncompressed sequence is equal to the original.

```
wget http://sweet.ua.pt/pratas/datasets/AminoAcidsCorpus.zip
unzip AminoAcidsCorpus.zip
cp AminoAcidsCorpus/HI .
./gto_amino_acid_compressor -v -l 2 HI
./gto_amino_acid_decompressor -v HI.co
cmp HI HI.de
```

## Chapter 6

# General purpose tools

The toolkit also has a set of tools with a more general-purpose, which were not designed to work with a specific data format. Instead, it was developed as an auxiliary component to help the construction of pipelines combining all the described subsets. This contains tools for char manipulations, such as reversing, segmentation and permutation, for manipulating numerical scores, such sum, filter, calculate the min and the max of a numeric matrix mainly originated from the tools' outputs. The current available tools for general purposes are:

1. `gto_char_to_line`: it splits a sequence into lines, creating an output sequence which has a char for each line.
2. `gto_reverse`: it reverses the order of a sequence.
3. `gto_new_line_on_new_x`: it splits different rows with a new empty row.
4. `gto_upper_bound`: it sets an upper bound in a file with a value per line.
5. `gto_lower_bound`: it sets an lower bound in a file with a value per line.
6. `gto_brute_force_string`: it generates all combinations, line by line, for an inputted alphabet and specific size.
7. `gto_real_to_binary_with_threshold`: it converts a sequence of real numbers into a binary sequence, given a threshold.
8. `gto_sum`: it adds decimal values in file, line by line, splitted by spaces or tabs.
9. `gto_filter`: it filters numerical sequences.
10. `gto_word_search`: it search for a word in a file.
11. `gto_permute_by_blocks`: it permutates by block sequence, FASTA and Multi-FASTA files.
12. `gto_info`: it gives the basic properties of the file, namely size, cardinality, distribution percentage of the symbols, among others.

13. `gto_segment`: it segments a filtered sequence.
14. `gto_comparative_map`: it creates a visualization for comparative maps.
15. `gto_max`: it computes the maximum value in each row between two files.
16. `gto_min`: it computes the minimum value in each row between two files.
17. `gto_geco`: it compress and decompress genomic sequences for storage purposes.

## 6.1 Program `gto_char_to_line`

The `gto_char_to_line` splits a sequence into lines, creating an output sequence which has a char for each line.

For help type:

```
./gto_char_to_line -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_char_to_line` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence file.

The attribution is given according to:

```
Usage: ./gto_char_to_line [options] [--] args]
or: ./gto_char_to_line [options]
```

It splits a sequence into lines, creating an output sequence which has a char for each line.

```
-h, --help          show this help message and exit
```

Basic options

```

## 6.2 Program `gto_reverse`

The `gto_reverse` reverses the order of a sequence file.

For help type:

```
./gto_reverse -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_reverse` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence file.

The attribution is given according to:

```
Usage: ./gto_reverse [options] [--] args]
or: ./gto_reverse [options]

## 6.3 Program `gto_new_line_on_new_x`

The `gto_new_line_on_new_x` splits different rows with a new empty row.

For help type:

```

./gto_new_line_on_new_x -h

```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_new_line_on_new_x` program needs two streams for the computation, namely the input and output standard. The input stream is a matrix file format with 3 columns.

The attribution is given according to:

```
Usage: ./gto_new_line_on_new_x [options] [--] args]
       or: ./gto_new_line_on_new_x [options]

It splits different rows with a new empty row.

Example: ./gto_new_line_on_new_x < input > output
```

An example of such an input file is:

```
1   2   2
1   2   2
4   4   1
10  12  2
15  15  1
45  47  3
45  47  3
45  47  3
45  47  3
55  55  1
```

## Output

The output of the `gto_new_line_on_new_x` program is a 3 column matrix, with an empty line between different rows.

Using the input above, an output example for this is the following:

```
1.000000    2.000000    2.000000
1.000000    2.000000    2.000000

4.000000    4.000000    1.000000

10.000000   12.000000    2.000000

15.000000   15.000000    1.000000

45.000000   47.000000    3.000000
45.000000   47.000000    3.000000
45.000000   47.000000    3.000000
45.000000   47.000000    3.000000
```

```
55.000000    55.000000    1.000000
```

## 6.4 Program `gto_upper_bound`

The `gto_upper_bound` sets an upper bound in a file with a value per line.

For help type:

```
./gto_upper_bound -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_upper_bound` program needs two streams for the computation, namely the input and output standard. The input stream is a numeric file.

The attribution is given according to:

```
Usage: ./gto_upper_bound [options] [--] args]
       or: ./gto_upper_bound [options]

It sets an upper bound in a file with a value per line.

    -h, --help                show this help message and exit

Basic options
    -u, --upperbound=<int>    The upper bound value
    < input.num               Input numeric file (stdin)
    > output.num              Output numeric file (stdout)

Example: ./gto_upper_bound -u <upperbound> < input.num > output.num
```

An example of such an input file is:

```
0.123
3.432
2.341
1.323
7.538
4.122
0.242
0.654
5.633
```

### Output

The output of the `gto_upper_bound` program is a set of numbers truncated at the a defined upper bound. Using the input above, an output example for this is the following:

```
Using upper bound: 4
0.123000
3.432000
2.341000
1.323000
4.000000
4.000000
0.242000
0.654000
4.000000
```

## 6.5 Program gto\_lower\_bound

The `gto_lower_bound` sets an lower bound in a file with a value per line.

For help type:

```
./gto_lower_bound -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_lower_bound` program needs two streams for the computation, namely the input and output standard. The input stream is a numeric file.

The attribution is given according to:

```
Usage: ./gto_lower_bound [options] [--] args]
or: ./gto_lower_bound [options]

It sets an lower bound in a file with a value per line.

    -h, --help                show this help message and exit

Basic options
    -l, --lowerbound=<int>    The lower bound value
    < input.num               Input numeric file (stdin)
    > output.num              Output numeric file (stdout)

Example: ./gto_lower_bound -l <lowerbound> < input.num > output.num
```

An example of such an input file is:

```
0.123
3.432
2.341
1.323
7.538
4.122
0.242
```

```
0.654
5.633
```

## Output

The output of the `gto_lower_bound` program is a set of numbers truncated at the a defined lower bound. Using the input above, an output example for this is the following:

```
Using lower bound: 2
2.000000
3.432000
2.341000
2.000000
7.538000
4.122000
2.000000
2.000000
5.633000
```

## 6.6 Program `gto_brute_force_string`

The `gto_brute_force_string` generates all combinations, line by line, for an inputted alphabet and specific size.

For help type:

```
./gto_brute_force_string -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_brute_force_string` program needs some paramenters for the computation, namely the alphabet and the key size.

The attribution is given according to:

```
Usage: ./gto_brute_force_string [options] [--] args]
or: ./gto_brute_force_string [options]
```

It generates all combinations, line by line, for an inputted alphabet and specific size.

```
-h, --help          show this help message and exit
```

Basic options

```
-a, --alphabet=<str> The input alphabet
-s, --size=<int>     The combinations size
> output             Output all the combinations (stdout)
```

```
Example: ./gto_brute_force_string -a <alphabet> -s <size> > output
```

## Output

The output of the `gto_brute_force_string` program is a set of all possible word combinations with a defined size, using the input alphabet.

Using the input above with the alphabet "abAB" with the word size of 3, an output example for this is the following:

```
aaa
aab
aaA
aaB
aba
...
BBb
BBA
BBB
```

## 6.7 Program `gto_real_to_binary_with_threshold`

The `gto_real_to_binary_with_threshold` converts a sequence of real numbers into a binary sequence, given a threshold. The numbers below to the threshold will be 0.

For help type:

```
./gto_real_to_binary_with_threshold -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_real_to_binary_with_threshold` program needs two streams for the computation, namely the real sequence as input. These numbers should be splitted by lines.

The attribution is given according to:

```
Usage: ./gto_real_to_binary_with_threshold [options] [--] args]
or: ./gto_real_to_binary_with_threshold [options]
```

It converts a sequence of real numbers into a binary sequence given a threshold.

```
-h, --help                show this help message and exit
```

#### Basic options

```
-t, --threshold=<dbl>    The threshold in real format
< input.num              Input numeric file (stdin)
> output.bin             Output binary file (stdout)
```

```
Example: ./gto_real_to_binary_with_threshold -t <threshold> < input.num > output.bin
```

An example of such an input file is:

```
12.25
1.2
5.44
5.51
7.97
2.34
8.123
```

## Output

The output of the `gto_real_to_binary_with_threshold` program is a binary sequence.

Using the input above with the threshold of 5.5, an output example for this is the following:

```
1
0
0
1
1
0
1
```

## 6.8 Program `gto_sum`

The `gto_sum` adds decimal values in file, line by line, splitted by spaces or tabs.

For help type:

```
./gto_sum -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_sum` program needs program needs two streams for the computation, namely the input, which is a decimal file.

The attribution is given according to:

```
Usage: ./gto_sum [options] [--] args
or: ./gto_sum [options]
```

It adds decimal values in file, line by line, splitted by spaces or tabs.

```
-h, --help          show this help message and exit
```

Basic options

```
< input.num        Input numeric file (stdin)
```

```

> output.num      Output numeric file (stdout)

Optional
-r, --sumrows      When active, the application adds all the values line by line
-a, --sumall       When active, the application adds all values

Example: ./gto_sum -a < input.num > output.num

```

An example of such an input file is:

```

0.123   5   5
3.432
2.341   3   2
1.323
7.538   5
4.122
0.242
0.654
5.633   10

```

## Output

The output of the `gto_sum` program is a sum of the elements in the input file.

Executing the application with the provided input and with the flag to add only the elements in each row, the output of this execution is:

```

10.123000
3.432000
7.341000
1.323000
12.538000
4.122000
0.242000
0.654000
15.633000

```

## 6.9 Program `gto_filter`

The `gto_filter` filters numerical sequences using a low-pass filter.

For help type:

```

./gto_filter -h

```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_filter` program needs two streams for the computation, namely the input and output standard. The input stream is a numeric file.

The attribution is given according to:

```
Usage: ./gto_filter [options] [--] args]
or: ./gto_filter [options]
```

It filters numerical sequences using a low-pass filter.

```
-h, --help                show this help message and exit
```

#### Basic options

```
< input.num              Input numeric file (stdin)
> output.num             Output numeric file (stdout)
```

#### Optional

```
-w, --windowsize=<int>   Window size (default 0)
-d, --drop=<int>         Discard elements (default 0.0)
-t, --windowtype=<int>   Window type (0=Hamm, 1=Hann, 2=Black, 3=rec) (default 0 (Hamm))
-c, --onecolumn           Read from one column
-p, --printone           Print one column
-r, --reverse            Reverse mode
```

```
Example: ./gto_filter -w <windowsize> -d <drop> -t <windowtype> -c -p -r < input.num > output.num
```

An example of such an input file is:

```
1    1.77
5    2.18
10   2.32
15   3.15
20   2.52
25   4.43
30   1.23
```

## Output

The output of the `gto_filter` program is a numeric file, identical of the input.

Using the input above with the window size of 3, an output example for this is the following:

```
Got 7 entries from file
1    2.085
5    2.256
10   2.507
15   2.757
20   2.905
25   2.860
30   2.674
```

## 6.10 Program `gto_word_search`

The `gto_word_search` search for a word in a file. It is case sensitive.

For help type:

```
./gto_word_search -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_word_search` program needs two streams for the computation, namely the input and output standard. The input stream is a text file.

The attribution is given according to:

```
Usage: ./gto_word_search [options] [--] args]
       or: ./gto_word_search [options]

Searching for a word in a text file. It is case sensitive.

    -h, --help           show this help message and exit

Basic options
    -w, --word=<str>    Word to search in the file
    < input.txt         Input text file (stdin)
    > output.txt        Output text file (stdout)

Example: ./gto_word_search -w <word> < input.txt > output.txt
```

An example of such an input file is:

```
No guts, no story. Chris Brady
My life is my message. Mahatma Gandhi
Screw it, let's do it. Richard Branson
Boldness be my friend. William Shakespeare
Keep going. Be all in. Bryan Hutchinson
My life is my argument. Albert Schweitzer
Fight till the last gasp. William Shakespeare
Leave no stone unturned. Euripides
```

## Output

The output of the `gto_word_search` program is a text file with the matching paragraphs and the location of the word found.

Using the input above with the word "Shakespeare", an output example for this is the following:

```
Found match in range [ 1536 : 2048 ]
Boldness be my friend. William Shakespeare

Found match in range [ 3072 : 3584 ]
Fight till the last gasp. William Shakespeare
```

## 6.11 Program gto\_permute\_by\_blocks

The `gto_permute_by_blocks` permutes by block sequence, FASTA and Multi-FASTA files. For help type:

```
./gto_ -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_permute_by_blocks` program needs two streams for the computation, namely the input and output standard. The input stream is a sequence, FASTA or Multi-FASTA file.

The attribution is given according to:

```
Usage: ./gto_permute_by_blocks [options] [--] args]
or: ./gto_permute_by_blocks [options]

It permutes by block sequence, FASTA and Multi-FASTA files.

-h, --help                show this help message and exit

Basic options
-b, --numbases=<int>      The number of bases in each block
-s, --seed=<int>          Starting point to the random generator
< input                   Input sequence, FASTA or Multi-FASTA file format (stdin)
> output                  Output sequence, FASTA or Multi-FASTA file format (stdout)

Example: ./gto_permute_by_blocks -b <numbases> -s <seed> < input.fasta > output.fasta
```

An example of such an input file is:

```
>AB000264 |acc=AB000264|descr=Homo sapiens mRNA
ACAAGACGGCCTCTGCTGCTGCTGCTCCTCGGGGCCACGGCCCTGGAGGTTCCACCGCTGCCCTGCTGCCATTGTCCCC

TAAACCTCACCCATGAATGCTCGCAACACGCAAGTTTAATTCGCAAGTTAGACCTGAACGGGAGGTGGCCACGCAAGTT
```

### Output

The output of the `gto_permute_by_blocks` program is a sequence, FASTA or Multi-FASTA file permuted following some parameters.

Using the input above with the base number as 80, an output example for this is the following:

```
GGCCCCACCTAAGGAAAAGCAGCCTCCTGACTTTCTCGCTTGGGCCGAGACAGCGAGCATATGCAGGAAGCGGCAGGAA
GTGGTTTGAGTGGACCTCCGGGGCCCTCATAGGAGAGGAAGCTCGGGAGGTGGCCAGGCGGCAGGAAGCAGGCCAGTGCC

```

## 6.12 Program gto\_info

The `gto_info` gives the basic properties of the file, namely size, cardinality, distribution percentage of the symbols, among others.

For help type:

```
./gto_info -h
```

In the following subsections, we explain the input and output paramters.

### Input parameters

The `gto_info` program needs two streams for the computation, namely the input and output standard. The input stream is a file withou any specific format.

The attribution is given according to:

```
Usage: ./gto_info [options] [--] args]
or: ./gto_info [options]

It gives the basic properties of the file, namely size, cardinality, distribution
percentage of the symbols, among others.

    -h, --help      show this help message and exit

Basic options
    < input          Input file (stdin)
    > output          Output read information (stdout)

Optional
    -a, --ascii      When active, the application shows the ASCII codes

Example: ./gto_info < input > output

Output example :
Number of symbols : value
Alphabet size     : value
Alphabet          : value
Symbol distribution:
<Symbol/Code ASCII> <Symbol count> <Distribution percentage>
```

An example of such an input file is:

```
>AB000264 |acc=AB000264|descr=Homo sapiens mRNA
ACAAGACGGCCTCCTGCTGCTGCTGCTCCTCGGGGCCACGGCCCTGGAGGGTCCACCGCTGCCCTGCTGCCATTGTCCCC

TAAACCTCACCCATGAATGCTCGCAACACGCAAGTTTAATTGCAAGTTAGACCTGAACGGGAGGTGGCCACGCAAGTT
```

## Output

The output of the `gto_info` program is a set of information related to the file read.

Using the input above, an output example for this is the following:

```

## 6.13 Program `gto_segment`

The `gto_segment` segments a filtered sequence.

For help type:

```
./gto_segment -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_segment` program needs two streams for the computation, namely the input and output standard.

The input stream is a numeric file.

The attribution is given according to:

```
Usage: ./gto_segment [options] [--] args]
       or: ./gto_segment [options]

It segments a filtered sequence.

    -h, --help                show this help message and exit

Basic options
    -t, --threshold=<dbl>    The segment threshold
    < input.num              Input numeric file (stdin)
    > output                  Output the segment file (stdout)

Example: ./gto_segment -t <threshold> < input.num > output
```

An example of such an input file is:

```
1    1.77
5    2.18
10   2.32
15   3.15
20   2.52
25   4.43
30   1.23
```

## Output

The output of the `gto_segment` program is the interval of values “below the threshold.

Using the input above with a threshold of 3, an output example for this is the following:

```
0:10
```

## 6.14 Program `gto_comparative_map`

The `gto_comparative_map` creates a visualization for comparative maps.

For help type:

```
./gto_comparative_map -h
```

In the following subsections, we explain the input and output parameters.

## Input parameters

The `gto_comparative_map` program needs an input file with the plot positions, respecting a defined structure.

The attribution is given according to:

```
Usage: ./gto_comparative_map [options] [--] args]
       or: ./gto_comparative_map [options]

It creates a visualization for comparative maps.

    -h, --help                Show this help message and exit

Basic options
    <FILE>                    Contigs filename with positions (.pos),

Optional

    -h                        Give this help,
    -V                        Display version number,
    -v                        Verbose mode (more information),
    -l <link>                 Link type between maps [0;4],
    -w <width>                 Chromosome width,
    -s <space>                 Space between chromosomes,
    -m <mult>                 Color id multiplication factor,
    -b <begin>                 Color id beggining,
    -c <minimum>              Minimum block size to consider,
    -i                        Do NOT show inversion maps,
    -r                        Do NOT show regular maps,
    -o <FILE>                 Output image filename with map,

Example: ./gto_comparative_map -o map.svg map.config
```

An example of such an input file is:

```
#SCF      5000000 5000000
aaa       1      1000000 1      1000000 bbbb    3000000 4000000 3000000 4000000
bbb       1500000 2000000 1500000 2000000 cccc    1500000 2000000 1500000 2000000
aaa       2000000 3000000 2000000 3000000 bbbb    3000000 2000000 3000000 2000000
```

## Output

The output of the `gto_comparative_map` program is a executing report, and a svg plot with the maps.

Using the input above, an output example for this is the following:

```
==[ PROCESSING ]=====
Printing plot ...
Found 2 regular regions.
Found 1 inverted regions.
Done!
```

```
==[ STATISTICS ]=====

## 6.15 Program `gto_max`

The `gto_max` computes the maximum value in each row between two files.

For help type:

```
./gto_max -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_max` program needs two streams for the computation, namely the input, which are two decimal files.

The attribution is given according to:

```
Usage: ./gto_max [options] [--] args]
or: ./gto_max [options]
```

It computes the maximum value in each row between two files.

```
-h, --help          Show this help message and exit
```

#### Basic options

```
-f, --first_file=<str>  File to compute the max
-s, --second_file=<str> The second file to do the max computation
> output.num           Output numeric file (stdout)
```

```
Example: ./gto_max -f input1.num -s input2.num > output.num
```

An example of such an input files are:

File 1:

```
0.123
3.432
2.341
1.323
7.538
4.122
0.242
0.654
5.633
```

File 2:

2.355
0.124
1.785
3.521
0.532
7.324
2.312
```

## Output

The output of the `gto_max` program is the numeric file with the maximum value for each row between both input files.

Executing the application with the provided input, the output of this execution is:

```
2.123000
5.312000
2.355000
1.323000
7.538000
4.122000
0.532000
7.324000
5.633000
```

## 6.16 Program `gto_min`

The `gto_min` computes the minium value in each row between two files.

For help type:

## 6.17 Program `gto_geco`

The `gto_geco` is able to provide additional compression gains over several top specific tools, while as an analysis tool, it is able to determine absolute measures, namely for many distance computations, and local measures, such as the information content contained in each element, providing a way to quantify and locate specific genomic events.

For help type:

```
./gto_geco -h
```

In the following subsections, we explain the input and output parameters.

### Input parameters

The `gto_geco` program needs a sequence to compress.

The attribution is given according to:

```
SYNOPSIS
    ./gto_geco [OPTION]... -r [FILE] [FILE]:[FILE]:[FILE]:[...]

SAMPLE
Run Compression      : ./gto_geco -v -l 3 sequence.txt
Run Decompression    : ./gto_gede -v sequence.txt.co
Run Information Profile : ./gto_geco -v -l 3 -e sequence.txt

DESCRIPTION
Compress and decompress genomic sequences for storage purposes.
Measure an upper bound of the sequences entropy.
Compute information profiles of genomic sequences.

-h, --help
usage guide (help menu).
```

```

-V, --version
    Display program and version information.

-F, --force
    force mode. Overwrites old files.

-v, --verbose
    verbose mode (more information).

-x, --examples
    show several running examples (parameter examples).

-s, --show-levels
    show pre-computed compression levels (configured parameters).

-e, --estimate
    it creates a file with the extension ".iae" with the
    respective information content. If the file is FASTA or
    FASTQ it will only use the "ACGT" (genomic) sequence.

-l [NUMBER], --level [NUMBER]
    Compression level (integer).
    Default level: 5.
    It defines compressibility in balance with computational
    resources (RAM & time). Use -s for levels perception.

-tm [NB_C]:[NB_D]:[NB_I]:[NB_H]:[NB_G]/[NB_S]:[NB_E]:[NB_A]
    Template of a target context model.
    Parameters:
    [NB_C]: (integer [1;20]) order size of the regular context
        model. Higher values use more RAM but, usually, are
        related to a better compression score.
    [NB_D]: (integer [1;5000]) denominator to build alpha, which
        is a parameter estimator. Alpha is given by 1/[NB_D].
        Higher values are usually used with higher [NB_C],
        and related to confident bets. When [NB_D] is one,
        the probabilities assume a Laplacian distribution.
    [NB_I]: (integer {0,1,2}) number to define if a sub-program
        which addresses the specific properties of DNA
        sequences (Inverted repeats) is used or not. The
        number 2 turns ON this sub-program without the
        regular context model (only inverted repeats). The
        number 1 turns ON the sub-program using at the same
        time the regular context model. The number 0 does
        not contemplate its use (Inverted repeats OFF). The
        use of this sub-program increases the necessary time
        to compress but it does not affect the RAM.
    [NB_H]: (integer [1;254]) size of the cache-hash for deeper
        context models, namely for [NB_C] > 14. When the
        [NB_C] <= 14 use, for example, 1 as a default. The
        RAM is highly dependent of this value (higher value
        stand for higher RAM).
    [NB_G]: (real [0;1]) real number to define gamma. This value

```

```

        represents the decayment forgetting factor of the
        regular context model in definition.
[NB_S]: (integer [0;20]) maximum number of editions allowed
        to use a substitutional tolerant model with the same
        memory model of the regular context model with
        order size equal to [NB_C]. The value 0 stands for
        turning the tolerant context model off. When the
        model is on, it pauses when the number of editions
        is higher than [NB_C], while it is turned on when
        a complete match of size [NB_C] is seen again. This
        is probabilistic-algorithmic model very useful to
        handle the high substitutional nature of genomic
        sequences. When [NB_S] > 0, the compressor used more
        processing time, but uses the same RAM and, usually,
        achieves a substantial higher compression ratio. The
        impact of this model is usually only noticed for
        [NB_C] >= 14.
[NB_E]: (integer [1;5000]) denominator to build alpha for
        substitutional tolerant context model. It is
        analogous to [NB_D], however to be only used in the
        probabilistic model for computing the statistics of
        the substitutional tolerant context model.
[NB_A]: (real [0;1]) real number to define gamma. This value
        represents the decayment forgetting factor of the
        substitutional tolerant context model in definition.
        Its definition and use is analogous to [NB_G].

... (you may use several target models with custom parameters)

-rm [NB_C]:[NB_D]:[NB_I]:[NB_H]:[NB_G]/[NB_S]:[NB_E]:[NB_A]
    Template of a reference context model.
    Use only when -r [FILE] is set (referential compression).
    Parameters: the same as in -tm.

... (you may use several reference models with custom parameters)

-r [FILE], --reference [FILE]
    Reference sequence filename ("-rm" are trained here).
    Example: -r file1.txt.

[FILE]
    Input sequence filename (to compress) -- MANDATORY.
    File(s) to compress (last argument).
    For more files use splitting ":" characters.
    Example: file1.txt:file2.txt:file3.txt.

```

In the following example, it will be downloaded seventeen DNA sequences, and compress and decompress one of the smallest (BuEb). Finally, it compares if the uncompressed sequence is equal to the original.

```

wget http://sweet.ua.pt/pratas/datasets/DNACorpus.zip
unzip DNACorpus.zip
cp DNACorpus/BuEb .
../../bin/gto_geco -v -l 2 BuEb
../../bin/gto_gede -v BuEb.co

```

```
cmp BuEb BuEb.de -l
```
